

Terraform task - 1

Launch Linux EC2 instances in two regions using a single Terraform file.

```
ec2-2regions.tf X
terraform-task1 > ec2-2regions.tf > ...
1  # 1. Providers configured
2  terraform {
3    required_providers {
4      aws = {
5        source  = "hashicorp/aws"
6        version = "~> 5.0"
7      }
8    }
9  }
10
11 # 2. Default Provider1 (Primary Region: N. Virginia)
12 provider "aws" {
13   region = "us-east-1"
14 }
15
16 # 3. Provider2 with an Alias (Secondary Region: Oregon)
17 provider "aws" {
18   alias  = "west"
19   region = "us-west-2"
20 }
21
22 # 4. Launching EC2 in the us-east-1
23 resource "aws_instance" "east_server" {
24   ami          = "ami-02167eae61967e403"
25   instance_type = "t2.micro"
26
27   tags = {
28     Name = "Linux-Server1"
29   }
30 }
31
32 # 5. Launching Ubuntu EC2 in us-west-2 using the provider alias
33 resource "aws_instance" "west_server" {
34   provider      = aws.west
35   ami           = "ami-02167eae61967e403"
36   instance_type = "t2.micro"
37
38   tags = {
39     Name = "Linux-Server2"
40   }
41 }
42
```

```
PS C:\Users\Kousick Devaraj\Desktop\DevOps\terraform\terraform-task1> terraform init
Initializing the backend...
```

Terraform has created a lock file `.terraform.lock.hcl` to record the provider selections it made above. Include this file in your version control repository so that Terraform can guarantee to make the same selections by default when you run "terraform init" in the future.

Terraform has been successfully initialized!

You may now begin working with Terraform. Try running "terraform plan" to see any changes that are required for your infrastructure. All Terraform commands should now work.

If you ever set or change modules or backend configuration for Terraform, rerun this command to reinitialize your working directory. If you forget, other commands will detect it and remind you to do so if necessary.

```
PS C:\Users\Kousick Devaraj\Desktop\DevOps\terraform\terraform-task1> █
```

```
PS C:\Users\Kousick Devaraj\Desktop\DevOps\terraform\terraform-task1> terraform plan
+ maintenance_options (known after apply)

+ metadata_options (known after apply)

+ network_interface (known after apply)

+ private_dns_name_options (known after apply)

+ root_block_device (known after apply)
}
```

Plan: 2 to add, 0 to change, 0 to destroy.

Note: You didn't use the -out option to save this plan, so Terraform can't guarantee to take exactly these actions if you run "terraform apply" now.

```
PS C:\Users\Kousick Devaraj\Desktop\DevOps\terraform\terraform-task1> █
```

```
PS C:\Users\Kousick Devaraj\Desktop\DevOps\terraform\terraform-task1> terraform apply
+ private_dns_name_options (known after apply)

+ root_block_device (known after apply)
}
```

Plan: 1 to add, 0 to change, 0 to destroy.

Do you want to perform these actions?

Terraform will perform the actions described above.

Only 'yes' will be accepted to approve.

Enter a value: yes

aws_instance.east_server: Creating...

aws_instance.east_server: Still creating... [00m10s elapsed]

aws_instance.east_server: Creation complete after 17s [id=i-0a304eabba2d263f7]

Apply complete! Resources: 1 added, 0 changed, 0 destroyed.

```
PS C:\Users\Kousick Devaraj\Desktop\DevOps\terraform\terraform-task1> █
```
